

Zeshi Zhong
Web Services
Final Project

This is a simple domain of the Contact Us page of a fictional national park.

The API will record inputs in the form of the name, email address, along with the subject and the contents of a message a user wishes to transmit to the administration of the park. Data will be recorded in a table schema structure.

The only route that exists starts with the user input in all required fields, followed by their submission of the data to the API. The input is processed by the API and, after being accepted through various data integrity checks, is stored in the table of a database that can be accessed by the administrators to view the comments and the messages of users.
