This project consists of a few parts, that needs to be delivered in a zip file and being sent to me by the end of Thursday **21rd March** in LEA.

 1- A Word(pdf) document that is explanation of the project. This document consists of these parts:

a. First paragraph gives a short description of the domain. This domain is optional and can be anything like (daycare, carwash, library or anything you prefer)
b. Second paragraph is description of the web API that you are going to create and how it can be useful for this project and fulfill the requirements.
c. Third one is the list of routes and a short description of the reason of having each route

2- Database export file to show your table and schema structure. You need to have at least 1 table but it is good if you investigate about joining multiple tables. However, it is optional.

3- A FrontEnd html page with script to fetch/post data to backend

4- A Video that you capture from your screen, that is a demo of your application (a short video not more than 6-8 min)

Please try to manage your time, in order to deliver the project on time.
